Dear Professor Ikehata,

essentially I have finished my paper for the International Symposium on Ship Propulsion. As I mentioned before the results of my last evaluation of the ISO/DIS example will serve to demonstrate the power of the rational method proposed and the inconsistency of the traditional method followed in the standard. The problems arising with simulated data, typically the EVEREST data, will be discussed in principle.

Concerning the correction I have applied to the power datum of run 3 I would greatly appreciate your response. Is there a misprint in the data as I suspect? Any other comment concerning my results will be most welcome. As soon as the paper is being mailed to the organisers in mid-May it will also be put on my website for formal discussion.

Sincerely yours, Michael Schmiechen.
